Steve Jobs

A Visionary in Technology Steve Jobs was born in 1955 in San Francisco, USA. He was a creative and intelligent man who changed the world of technology. In 1976, he co-founded Apple with his friend Steve Wozniak. They worked in a small garage and created the first Apple computer.

In 1984, Jobs introduced the Macintosh, a personal computer with a mouse and a graphic interface. It was a big revolution. However, in 1985, Apple's board removed him from the company. Jobs did not give up. He started a new company called NeXT and also helped create Pixar, the famous animation studio.

In 1997, Apple was in trouble, and Jobs returned as CEO. He introduced new and innovative products like the iMac, iPod, iPhone, and iPad. These devices changed the way people communicate, work, and listen to music. The iPhone, released in 2007, was a major success and transformed the mobile phone industry.

Steve Jobs was known for his passion, creativity, and perfectionism. He wanted technology to be simple, beautiful, and easy to use. He was also famous for his inspiring speeches. One of his most famous speeches was at Stanford University in 2005, where he said, "*Stay hungry, stay foolish*." Unfortunately, Jobs had health problems. He was diagnosed with cancer in 2003 and fought the disease for many years. He passed away in 2011, but his ideas and innovations continue to influence the world. Apple is still one of the most important technology companies today. Steve Jobs will always be remembered as a visionary who changed the way we use technology.
